

Finalized Medication RAG Decisions & Immediate Actions

Project-ready medication knowledge-base summary

1. Finalized Decisions

- Dataset: medication knowledge base for a RAG project.
- Current curated coverage: 154 generic medication records.
- Scope: pain/fever, antibiotics, antivirals, antifungals, respiratory, gastrointestinal, cardiovascular, diabetes/endocrine, neurology/psychiatry, allergy, nutrition, rheumatology/immunology, reproductive health, ophthalmology, dermatology and emergency medicine.
- Core fields: medication name, drug class, common uses, precautions/warnings, and adverse effects.
- Individualized dosing is excluded from the starter dataset because dose and duration depend on patient-specific factors.
- This is a broad starter knowledge base, not every medicine marketed worldwide.
- Generic names are the canonical identifiers; brand names can be stored as aliases.

2. Medication Safety Decisions

- Use as educational/reference information, not as an individualized prescription.
- Suitability depends on diagnosis, age, pregnancy, kidney/liver function, allergies, interactions, contraindications and local guidance.
- Prescription medicines, antibiotics, anticoagulants, opioids, insulin and other higher-risk medicines require appropriate clinical oversight.
- Current official labels and clinical guidelines should take priority over a static RAG record.
- Version and periodically refresh the knowledge base because medicine information changes.

3. Immediate RAG Actions

1. Store one medication as one logical document/chunk where practical.
2. Store metadata: generic_name, drug_class, therapeutic_area, common_uses, precautions, adverse_effects, aliases, source, source_date and version.
3. Create embeddings while retaining metadata for filtering and citations.
4. Attach an authoritative source to every production record.
5. Add freshness/version fields and a review schedule.
6. Test retrieval with uses, precautions, adverse effects and drug-class questions.
7. System rule: do not invent doses, contraindications, interactions or recommendations when retrieved evidence does not support them.

4. Recommended Record Structure

generic_name → drug_class → therapeutic_area → common_uses → precautions → adverse_effects → aliases → source → source_date → version

5. Immediate Deliverable

The completed medication starter PDF contains 154 medication records and can be used as the starting reference for ingestion into a RAG pipeline. For production clinical use, validate records against current authoritative sources before deployment.

6. Source / Scope Note

The dataset was framed using major authoritative medicine-information resources, including WHO essential-medicines resources and NIH/NLM medication information. A WHO essential-medicines list is a priority-medicines list, not a complete catalogue of every medicine worldwide.
